Milestone 3: Software Market Research Report & Presentation

I. Introduction

A brief summary of our team's project proposal is that we are planning on creating a mobile application that helps with productivity along with the addition of the implementation of game-like elements. Learning from the interviews in the user-centered design report from Milestone 2, our team plans to ensure our productivity app is a reliable, robust, and intuitive way to self-improve the user's life for the better. One of the main insights we've gained from Milestone 2's user research is making a pivot towards prioritizing our application for users who are parents as well as their children. Performing software market research with our pivot in mind will give us an idea of how viable this switch will be, as well as give insight into our competitors and how we can differentiate our team's app to ensure we're delivering something that is multifaceted while still being a quality product.

Even though we mainly have ideas and interview questions catered towards our original idea, there are still some highlights that we can apply to our pivot. Team RPG intends to continue with the user-centered design by interviewing and collecting more information regarding specifics catered to our current plans. Recreation of personas will be made as we go, as these are simplified generics of the users who will be interacting with our application. We intend to cater this to a multitude of age demographics as gamification applies well into the teenage-age groups. Our research encompasses existing applications that have these age groups so we can find trends to follow or implement upon.

II. Market Overview

After making the decision to pivot our application towards children-parent motivation; it has slightly skewed the market of where our application would fall under. In our first milestone, we stated that the application would have fallen under the gamification market, after making the decision to pivot it looks like the market of our application would primarily apply to the market involving game-based learning. A brief summary of what a game-based learning market involves incorporating game elements, mechanics, and design, into activities to help engage users, enhance motivation, and improve learning outcomes. When researching the market size it was discovered that the market size value in 2024 was 19.55 billion USD and is forecasted to grow up to 64.54 billion USD by 2030 as reported by Grand View Research. In the article provided by Grand View Research states along with the market growth the projected growth from the time span mentioned is 22.0%. Figure 1 is a graph provided by Grand View Research, below displays a graph providing a prediction of the market size in years prior to 2024 and the years up to 2030. Figure 1 also gives insight into the solution to service growth in each year past and future.

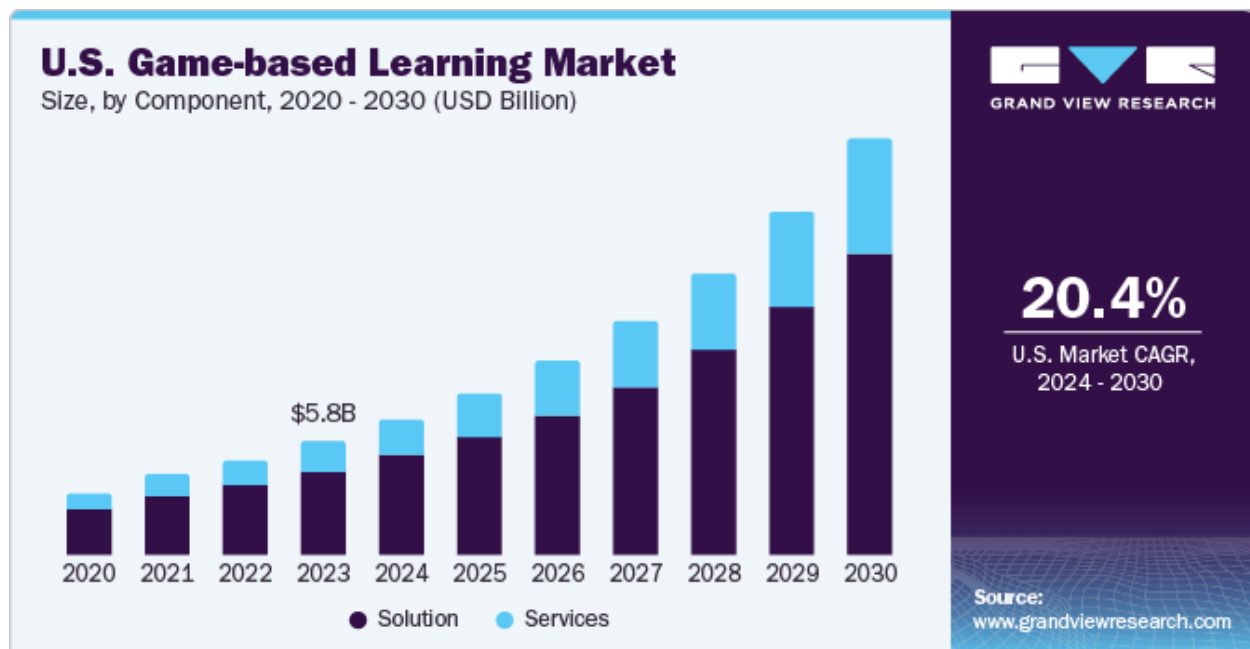

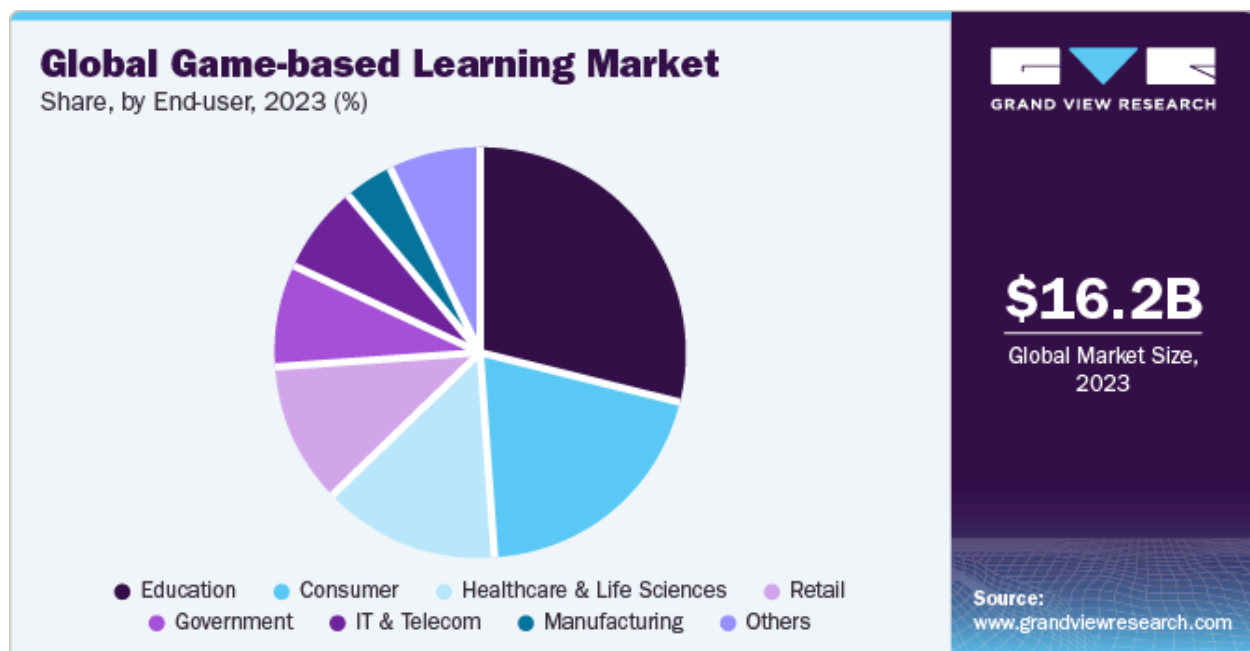

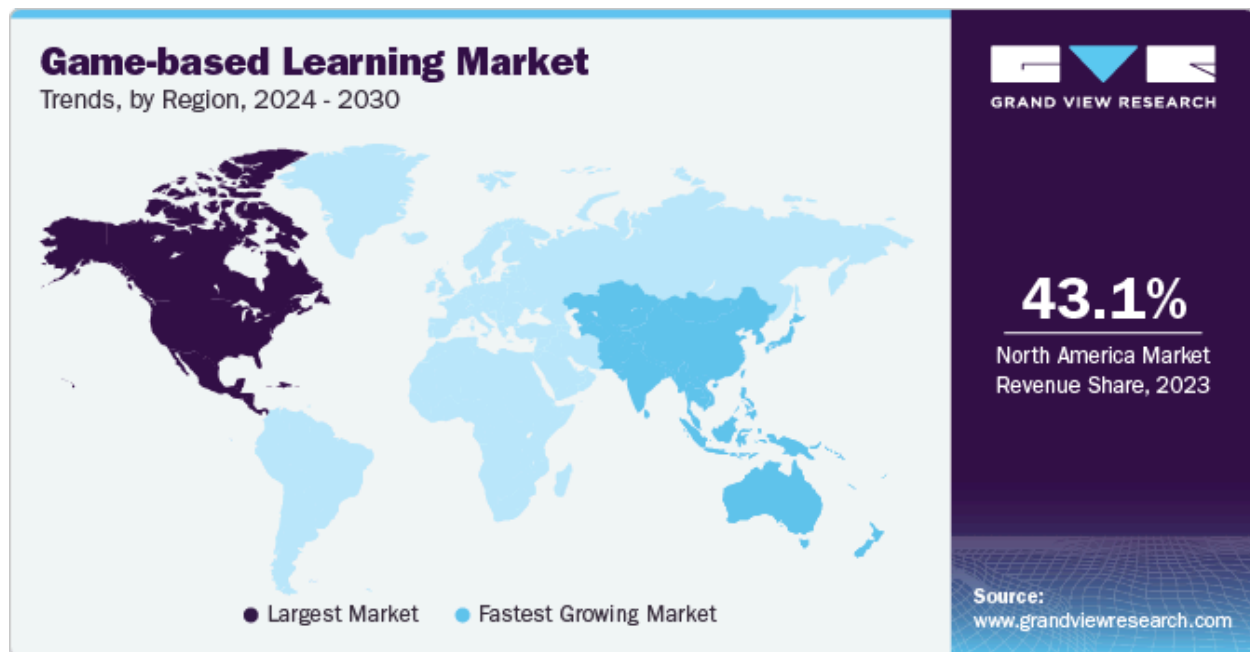

FIGURE 1: Market Growth

As we continued researching into the targeted market the major players in the game based-learning market were discovered. The article by Grand View Research provides a list of major players in our targeted market; those major players being: Amazon, Google, Duolingo, Mojang, Kahoot!, and Epic Games to name a few. After discovering the major players in the market, it was difficult to find a concrete number of the market share that the companies listed take part in for the potential reason that there is a broad range of products that can apply to the market or that the companies market share has not been publicly disclosed. Although we were unable to find company market share, we managed to discover the market share by end-user. In Figure 2, a pie chart provided by Grand View Research; this pie chart displays the largest revenue share in a sector in which game-based learning is applied. Some of the sectors that will be displayed on the pie chart are Education, Retail, Government, Consumer, etc. When analyzing Figure 2, it can be stated that the main sectors that are contributors of the market share are: Education, Consumer, and Healthcare & Life Sciences with the remaining tapering off.

[Figure 2: Market Share of Game-Based Learning Market by Sector](#)

When diving into the market trends for game-based learning it came to the team's understanding that North America accounted for more than 43.1% of the market revenue share in 2023 per Grand View Research. The article mentions that the driving factors of the market trend is due to the emphasis on continuous learning, skill development, presence of a large tech-savvy population, along with a strong demand for interactive and engaging educational tools. In Figure 3, of the article mentioned previously; it provides a global map with the color purple signifying the region with the largest market and different shades of blue indicating the fastest growing market. The map indicates that North America is the largest market with Asia following suit as the fastest growing. With this information provided we can look to capitalize on the market with defying elements that separate us from the products already out.

[Figure 3: Global Game-Based Learning Market Trends](#)

As we continue to conduct research into the market, a trend/shift that was recognized was the integration of particular technology such as Artificial Intelligence (AI), Augmented Reality

(AR), and Virtual Reality (VR). These mentioned technologies have been implemented in the market to help with things such as creating an immersive learning environment, creating personalized learning paths based upon individual performance and progress, as well simulating real-world scenarios. By performing market research we hope to take note of key observations as we continue to create an application that can separate us from the rest of the market

III. Competitor Analysis

1. HFK(hire/fire kids)

Overview: An app focused on allowing parents to have a more structured approach to having their kids do chores and do work to build up enough points to get rewards such as gift cards and self-esteem through parental control.

Features

- Hiring kids for jobs
- Marking striked for both kids and parents for fowl play or misbehaving
- Firing kids and adults for their poor performance
- Rewards are gift cards or literal cash
- Allow you to review chores set for your kids and adjust them accordingly

Evaluation

- **First impressions:** Hire and Fire kids (HFK) is an easy to use mobile app designed to help bring a structure to “hiring” kids to do certain chores or activities around the house. It gives kids a chance to earn points and money through being hired for tasks given by their mediator, the parents. The parents have control over all the settings. What the kids are hired for, how much time they have, how much they get paid or what kind of rewards

in general. The kids and parents alike also have reviews, strikes, and can fire one if the other makes too many mistakes or is not up to the other's standards.

- **Usability and user experience:** With the help of customizable rewards and personalized tasks via the parents, HFK can be helpful in motivating kids to do chores around the house with personalized incentives. The UI is very simple and easy to learn, allowing a fast learning curve and quick implementation of the app and its benefits. It is mainly meant for chores and jobs parents want for their kids so the app has little in terms of confusing details or aspects that might take away from the main purpose of the app.
- **Standout features and notable gaps:** The standout features I noticed were the main goal of the app mirrors our intentions with our app, with parents assigning tasks for their kids to do and giving them rewards. However, a gap I see is the whole gamify aspect of this whole deal that we want to implement. The only gamify aspect that is present in the HFK app is the reward system which is fairly shallow. There is also no automation to the tasks assigned. Everything is handled through the parent so they are expected to handle everything that the app is capable of.
- **User Review and Ratings**

Google Play:

Apple Store:

Ratings and Reviews

2. Habitica

Overview: An app that is not entirely focused on kids but incorporates the gamification aspects we aim to bring to our kid productivity app, which many others lack, is Habitica. It allows users to progress and earn in-game rewards that are not solely monetary, making goal achievement more engaging. Gold earned from reaching goals can be used to level up a character, which can then be played within the Habitica game, adding an extra layer of motivation and enjoyment.

Features

- Leveling system that is actually deep and thought out
- Gamify elements to keep users engaged
- Task and goal tracking for both short and long term
- Earn rewards through goal reaching and task completion
- Levels and rewards earned from task completion are utilized through the application game
- In app game involves you fighting bosses, giving a use for in game rewards that are not just monetary

Evaluation

- **First impressions:** Habitica is a very well implemented example of gamifying tasks that the user wants to accomplish. It incentivises good behaviors with rewards that aren't monetary based and have it still be rewarding to earn them. It keeps users incentivised through the rewards by having it progress their in-game character, which they can then use to fight in-game bosses and become even more powerful. This creates an in game economy that keeps users inside the app where as to not lose customers and as well keep their interest in the in game economy.

- Usability and user experience:** The in game leveling system and rewards help users see the benefits of completing tasks throughout their everyday lives. On top of that, having an hp (hitpoints) system and experience help you see where you went wrong in your routine and help users equate what they do in the game to in real life, since in real life you also gain more experience based on the tasks you do and hurt your own goals if you fail to accomplish certain steps. The UI is simple which allows users to engage with little confusion or distraction from their primary focus when using the app.
- Standout features and notable gaps:** A gap I notice in the app is in how little information it gives the user as to how they did in their daily activities. While it does give them xp and/or a health down if they do good or bad respectively, seeing exactly where they went wrong and how they can improve, as well as insight into how they long term goals are being handled and what they could do to improve, would be a very helpful addition. However, the major standout feature is the in-game economy Habitica has created with its leveling system and boss fighting mechanics. This gives the rewards the game offers more weight and feels more like a reward since it can be used to fight the in-game bosses and level up your character to become stronger.

3. Chores & Allowance Bot

Overview: Created by the company Wingboat, Chores & Allowance Bot is an application to help parents and children track their allowances, chores, and savings. It simplifies the process of assigning, tracking, and rewarding chores while helping children learn about financial responsibility. This application is available on iOS, Android, and on web browsers. It is designed to help parents give chore and task assignments to children in an easy and visual manner.

Features

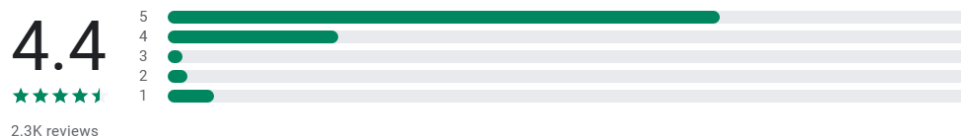

- You can customize daily, weekly, or monthly allowances and chores that can be approved manually or automatically.
- Assign chores to children and track completions with an user interface.
- Avatars and photos are available for kids to personalize their profiles.
- As mentioned in the overview, there is cross-device syncing.
- Visual representations of financials, chore charts, rotating chores, up-for-grabs chores; some are part of the free version while some are in the premium.
- There are basic reminders and notifications along with advanced ones along with customization of progress of chores.
- Parental and child controls to manage accounts and prevent unauthorized changes.

Evaluation

- **First Impressions:** The application is visually appealing and user-friendly, designed for both parents and children. It has an intuitive interface that allows easy set up, management of allowances, and assignments of chores quickly. There is also an onboarding process that guides the users through key features.

- **Usability and User Experience Insights:** Avatars and photos make it engaging for kids with cross-platform support allowing for users to easily open up the application. There is a lot of customizability that allows for flexibility in terms of allowance split, task management, etc. depending on parenting style. The intuitive navigation of the application makes it easy for parents to create the accounts, children to be linked, and delegation of chores. A lot of user reviews praised this as being a first-step into teaching financial aspects for their children along with increasing motivation in children to complete their tasks.
- **Standout Features or Notable Gaps:** Ledgers and graphs help visualize current progress and statistics of things such as chores completed and money made/spent. Parents are allowed to set frequency of chores and payment conditions. There is also an option for chore rotation that encourages shared responsibilities and up-for-grabs chores. Notable gaps include paywall to access the full features of the application. However it does not have gamification aspects which could further motivate kids such as leveling and badges.
- **User Review and Ratings**

Google Play:

App Store:

4. My First Nest Egg

Overview: This application was created by 2 mothers who wanted to teach their kids about financial literacy. It is a chore and allowance management application target for younger kids by

gamifying tasks and providing money management tips and goal settings set by parents. This application is available on mobile devices, specifically on iOS and Android through the Google Play store.

Features

- Parents can assign chores and track the completion of chores while children can earn the rewards for completing the chores.
- The application uses a feature of making a puzzle out of a picture to motivate children. Essentially the parent would take a picture of a reward and the application would split it up into a puzzle. Every completion towards the chore or task would slowly complete the puzzle.
- Children can set saving goals, there is a feature to track the amount of money the kids have. There is no built-in bank so parents have to deduct manually if money is involved.
- Another feature the app has is offering resources for users to teach financial skills and literacy. This is helpful for adults who want to teach children or even students about it.

Evaluation

- **First Impressions:** The application has visuals that appeal to young users such as children and students. Starting the usage of the application is straightforward and it has a guide that explains features and how to work the application. It gives examples for parents through the setup and customization options.
- **Usability and User Experience Insights:** Parents noted the application's intuitive design making assignment of chores and tracking rewards easy. Children find the puzzle-like way of completing chores/tasks engaging which encourages usage and consistency in behaviors. The financial education part of the application is a standout feature that

teaches users financial literacy in a virtual environment, but it can be applied in a real-life situation.

- **Standout Features or Notable Gaps:** The puzzle is a standout feature for this application. Parents say it keeps it interactive for their children. Notable gaps include adding more customization options in chore assignments such as adding multiple children to complete a task etc. This application was mainly made with the children's audience to be in the single digits, however the disconnect in interest grows as the child grows too. A need to cater for the older children is desired. More reasons for customizability include for different family and traditions.

IV. Opportunity Assessment

To expand on the SWOT Analysis diagram from above, the purpose of refactoring our project into a list of Strengths, Weaknesses, Opportunities, and Threats was to lay out these four key elements in a way to quickly visualize how they influence each other and draw conclusions from that as another data point. It's important to keep track of the opportunities that our strengths' provide us so that we can take advantage of and create even more opportunities without forgetting to cover the threats and weaknesses that are inherent to our unique product.

Gap Analysis: Solution to User Engagement

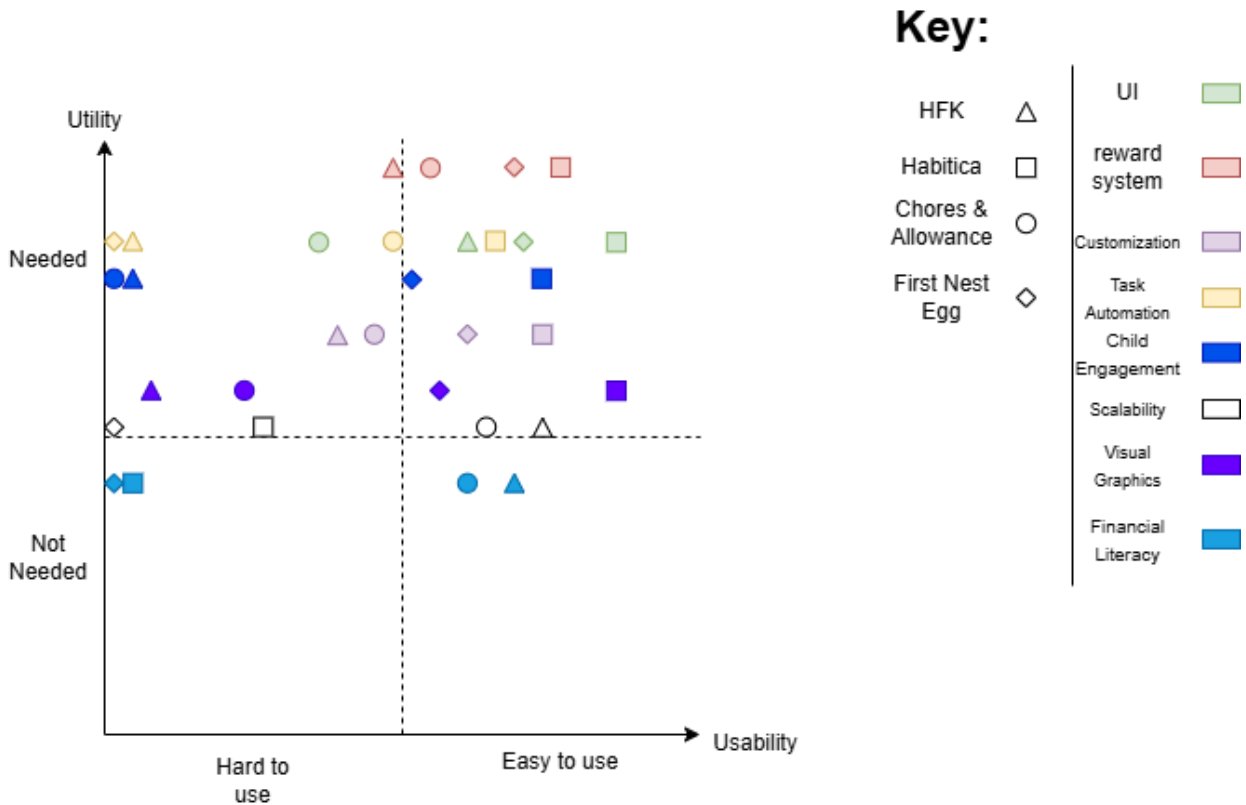

The purpose of this bar graph is to measure the amount of focus each individual business has towards incorporating gamification aspects into their products. This gap analysis bar graph highlights our belief that gamification is a solid solution to user engagement and our way of breaking into an established app market catered towards education, gaming, and productivity by attracting a solid user base by committing to a unique blend of all three.

V. Strategic Positioning

Our main strategy with our project and as our team is to build a gamify productivity app for parents and their children to help parents keep their kids engaged in their chores. We want to use aspects of gamify to make kids want to do their chores and to incentivise their good behavior with rewards such as in-game currency, levels, and customization. We want to capitalize on the market gap that involves gamifying tasks and chores for kids. While there are gamifying apps for

tasks such as habitica, and apps that help parents assign chores for kids, there is no app that gamifies chores for kids to help them reach their goals or finish daily chores. While most apps of this nature help with chores and task management, most of them do not have gamify aspects that we feel are essential. As for the few that do include gamify aspects, the execution is either shallow or does not do a good job of balancing the goal assistance of the app with the gamifying aspects of the app like with habitica. While it has many impressive gamifying features, the chore and goal tracking is fairly shallow and is all manual with little feedback as to how the user did during a given time period. The biggest challenge we see when it comes to bringing this project to fruition is creating an engaging app that incentivizes good behavior when it comes to productivity, as well as giving proper feedback and a good user experience that they will find helpful in their goal reaching endeavors. The market gap we will be trying to capitalize on is the gap of a gamifying app parents can use to help their kids become productive in the household as well as in their life. We want to help parents assign tasks to their kids, view feedback on how they did in a given time period, where they can improve, and helpful automation where the app can offer guidance for where to improve and how they did compared to the last progress report.

Differentiation Matrix

VI. Conclusion

Ultimately, team RPG has pivoted its project to make a gamifying productivity app directed towards children. The application will be for parents to assign their children chores and tasks to do, and for me to complete these requests to gain in-game rewards. We are aiming to make a game rewarding enough to motivate chores being done consistently in a timely manner.

Although our project is more niche, we are making a product in a game-based learning market, which is expected to grow about three times in size between now and 2030. Some of the biggest companies in the market are Amazon, Google, Duolingo, Mojang, Kahoot!, and Epic Games. None of these players in this market cover the niche field of a parent and child gamifying app. However, our research for the share-end user shows that the largest revenue shares in the market sector is education and consumer. Our team will consider this when honing in on the type of game we are making. The questions we have to review is how we may teach financial literacy

into our game as a means of implementing education. Solving this will improve our perception of our softwares benefits to parents.

We had looked at various different competitors making mobile applications with similar end-user goals as ours. HFK's implementation treats chores as a job and children are "hired" for them. Parents are giving full control of how their child is hired, fired, the job they do, and the reward system. Overall, the app is simple and intuitive, but hardly uses any gamifying aspects and has mixed reviews on both iOS and Android. Habitica is one of the most successful gamifying apps, but serves as a more general purpose application not only for children but for any individual who seeks to improve their motivation and discipline by using gamifying elements. Our mobile application narrows on a more specific audience in children while still giving a solution to a wide world problem of getting your children to do the tasks a parent asks them too. However, Habitica serves to be a fantastic standard for the features we should consider putting into our own product. Chores and Allowance Bot is a fairly similar idea to our own, but not only allows parents to assign chores but to set a weekly or monthly allowance system too. It is acclaimed to teach children about financial literacy at an early age. Our project differs from the Chores and Allowance Bot because it does not have any significant gamifying elements besides its limited customization. We are hoping to make a product for young children feel consistently engaging enough to make chores and tasks feel rewarding and enjoyable. Finally, My First Nest Egg also combines chores and financial literacy into one app. Its standout feature is the puzzle; A parent will take a picture of a reward and their children will complete tasks to reveal more parts of the picture. This application's weakness is that the allowance and transfer of money is manual, leaving room for another application to integrate money transfer between the family for ease of

use. Overall, our research on these competitors had helped us pinpoint ways to stand out as a software amongst the rest.

Our opportunity assessment provides both incites and hurdles our team must consider during the design process. Notably, how do we make an gamifying application engaging while ensuring we fall under the strict regulations of children applications. We must also think of methods to streamline the process of assignment and overlook the completion of tasks making it easy and not time consuming for parents. Another weakness is the timeline we have to complete this project, which limits how robust we can make the gamifying elements of the app. Still, there are overwhelming strengths of our idea in using video games rewarding systems that have proven effective for children and promotes positive habits. We are also confident in the uniqueness of our product as we emphasize gamifying elements to further motivate users.

Our next steps are based on our research starting to brainstorm the design of our software. We must discuss and plan the type of game we are working to make, answer questions such as how our progression will work, how completing tasks affects the gamifying elements, and how parents play a factor in the progression in the game. We must find a way to make customization a motivating factor for children. Finally, we understand the importance of making the parent's experience with the app as simple and intuitive to use as possible while also giving them enough control and flexibility with the tasks.

Detailed User Reviews and Feedbacks

All of our significant competitors can be found on both the Google Play Store and Apple's App Store. Both of these marketplaces have a rating system that ranges from 1 Star to 5 Stars, 1 being the lowest.

HFK

Hire & Fire Your Kids has a total of 89 ratings on the Play Store as well as an overall rating of 2.8 out of 5. Most of the reviews are 1-star reviews and we will dive deeper into why some users feel inclined to give HFK only one star. The second highest majority of reviews, however, are positive (5 stars). Several users complained about the paywall/subscription model while a majority of users had grievances with the app's functionality. Users reported experiencing bugs, slowdowns, and inability to create an account.

On the App Store HFK has a rating of 3.8 out of 5, but it has a significantly lower total number of reviews (14). There were several reviewers complaining about the apps ease of use and a lack of smooth or uninterrupted functionality. Several users complained about the app crashing. There are no significantly constructive criticism to be found on the App Store's review section for HFK.

Notable Reviews:

★★★★★ June 23, 2020

Honestly, I have tried so many apps for my family to organize chores and it's such a headache. I've also hated the idea of a set allowance. I feel like this app clearly sets the expectations for your kids and teaches them so much in regards to initiative. My youngest is 6, and even though it is trickier for him to manage, he can ask for help whenever and clearly understands the "you're going to get an 'X' if you keep doing that!" I've never seen my kids so eager to do chores!

★★★★★ August 3, 2020

Excellent tool to help kids become independent and take responsibility for helping around the home. Very customizable and user friendly. It's great that you set it up on all devices and we can send reminders and pictures when items aren't completed. The strike system is an adjustment for kids, but once they see how much money they could have made, it starts to sink in. We had a family meeting and setup chores based on everyone's input which definitely helped us.

★☆☆☆☆ January 18, 2023

Mostly seems good but I wish I could have chores only assigned to one kid. However, what is making me leave only after a couple days is how painfully slow the system is. It takes forever to do something! Even go to a different page. And editing a chore it takes sometimes up to 2 minutes to load! I spend hours, about 4 loading chores on yesterday and refuse to do it anymore.

Habitica

Habitica has an overwhelmingly high number of 5-star reviews on the Play Store and they make up the majority of their 62,000+ reviews on that marketplace and roughly 2000 on the App Store. Of the 1-Star reviews, several reviewers complain about the removal of significant social features that allowed them to be held accountable for tasks. Other users have complaints

about the overall theme and artstyle of Habitica, which quite honestly is no fault of the developers. Other reviewers have more general complaints regarding bug reports not being addressed. A select few feel that the moderation for toxic players is nonexistent and that forced them to give up the app entirely. Many 5-Star reviewers feel grateful that Habitica has helped them with their productivity and mental health related to it. Others enjoy the ability to tailor the game to their own needs.

Notable Reviews:

★☆☆☆☆ August 10, 2023

Used to be one of the best task managing apps out there, even without the gamified features. The biggest selling point was its online community as you could connect with people and hold each other accountable. Unfortunately, due to a falling out with their volunteer mod team a few months back, they've now removed almost all social features. I can no longer recommend habitica.

★☆☆☆☆ February 13, 2019

DL'd to try this app out, but could not get past the initial setup. Buttons missing labels or information, lethargic loading issues, and the graphics are really sub par for what other games host currently. Even the initial avatar appearance has most things locked behind a pay wall, and keeps putting me in a wheelchair! The idea behind the app has a lot of potential, and would be a joy to see if they can make it better and working properly. Will have to wait and see. As is? Not functional.

★★★★★ February 23, 2025

Habitica has changed my life. I suffer from severe major depressive disorder and often have difficulty doing even very basic, routine things, but after four months with Habitica, I've seen improvement in my ability to do my daily mundane tasks that I would not have believed possible. Multiple days, I was only able to motivate myself to do various things by not wanting to incur damage or wanting to deal more damage to a quest boss. If you have depression or ADHD, this could be a gamechanger.

SPAWNofSPOHN, 03/06/2023

Productivity disguised as a game

I'm in my mid 20's and got into a mental slump when the pandemic hit and I was working a job that drained every ounce of life that I could give. The only way I could recharge was spending time with my friends, so that was all I wanted to do.

Since then I've gotten married, moved jobs twice to something that I now love more than anything, gotten 2 cats and a new, bigger apartment. But I still find myself in that mental slump of 0 motivation to do anything but be with people.

This app, this game, gave me real-time rewards for doing the mundane, rather than having to wait and see if or when my wife would thank me for doing the dishes or taking out the trash as needed. I had habits that I wanted to break (such as setting repeat alarms or getting back into bed after turning off my alarm and potentially falling back asleep). I wanted to do daily chores to try and get rid of the cockroaches that started to infest our apartment, as of 2 weeks ago, they're all but gone. This app works if you find fulfillment in being rewarded for doing things, mundane things. I highly recommend this to anyone who wants to restart and have a valuable tool to do so

Chores and Allowances Bot

This app has 2000 reviews on the Play Store and over 9000 on the App Store. One reviewer noted that the lack of being able to add another parent feels like it should be a basic feature. Another reported that a lack of platform compatibility limits them to one device. This is due to there not being a PC version of the app. Other reviewers noted that they switched from other apps to this one and they now prefer it. Many like the ability to rotate chores between children and to have a task up for grabs for anybody. As for negative reviews, the majority were citing bugs, slowdowns, or crashing. Others stood out where they claim that trying to unsubscribe leads to broken links and spam emails.

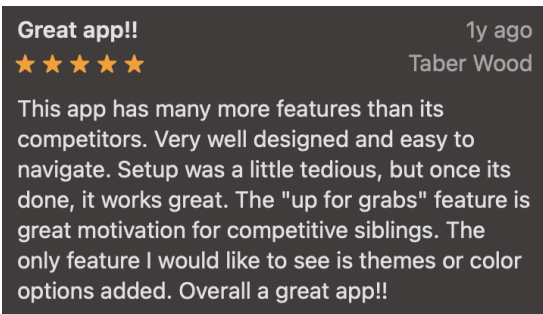

Notable Reviews:

★★★★ January 30, 2020

The app works great, the style and organization is wonderful. We all love the app, except there isn't a place for rewards. The kids liked seeing the rewards they were working towards, not just a dollar amount. Also it would be nice if the parents could have separate profiles. Other than that I would have given 5 stars all the way! Also we haven't experienced any bugs or glitches like we have with other chore apps. Ex. Assigned chores disappearing, or showing on the wrong dates etc.

★★★★★ June 14, 2022

The app is great once you have it set up. My kids enjoy it. Really wish I could adjust the chores list under the chore assignment to have it organized by category rather than alphabetical. The other thing that took a while to figure out is the scheduling a rotation. They have a daily chore but they want to rotate the assignment schedule monthly. I have to make it a monthly chore select everyday of the month (only 28?) and set it that way. It is not as intuitive as it could be.

★☆☆☆☆ December 26, 2022

While this app was only good for a month or so as motivation for my kids. It definitely wasn't worth the amount the asked. My main issue now is all the spam I get from them. When I try to unsubscribe it brings me to a Brocken url. Leaving me no choice but to report the emails as spam. Please fix this issue. And with my opinion. If this is a trick from the devs, then stay away from this app. If this is a mistake and they change to a one time paid app. I would easily pay 20\$ for something like this

My First Nest Egg

While this app only has 57 total reviews on the Play Store and 58 on the App Store, 5-Star reviews make up an overwhelming majority of total reviews. One reviewer brings up the fact that the app is not inclusive to children that have not yet started reading. Others dislike that it is a web based app. Another user noted that some of the core features like money adding up do not seem to work correctly. Positive reviews indicate that their young children enjoy completing the puzzles as well as their chores. Along with that they feel that this is a good tool for teaching money management at such a young age. Some feedback from reviewers regarded a lack of overall features and customization that would help tailor the app toward certain individuals.

Notable Reviews:

Coacho22, 03/22/2024

Not for Littles

I wanted to like this app, especially since it's marketed for those under 6. But there's no supports for pre or emergent readers. Moreover, the app itself isn't super user friendly and there's no time of day settings. (I.e. a task for teeth brushing but for a task rabbit kiddo, they want to check it off right away. I need two of those - one in the morning and one at night. There's no way to do that and set reminders. At this point, idk what I'm enabling for notifications. I love the financial literacy component, but emergent readers need someone to read and guide them through these lessons.

★★★★★ January 21, 2025

Amazing! Immediate response and adoption by a 9 and 6 yr old. They want to complete the puzzles. They are both learning what money is and this is helping them translate that to work, earn money, save or spend. It took a few tries to get the chore list customized to our needs and add in the earns, but they enjoy their view to request and redeem their rewards. Thank you for the design and features. I'm looking forward to a few features to be developed - editing an existing chore puzzle/list.

★☆☆☆☆ September 26, 2023

Web based as an app. Too slow to function.

★★★★★ February 12, 2023

I want to like it a lot. It works... Okay but has a lot of limitations and issues. The biggest of which is that the math doesn't always add up which is a big problem for a money tracking app. For example, I have an egg with \$3 in spend and the transfer screen says \$14 is available, which is more than the entire thing so I have no idea where it's even getting that. The view only mode for kids also just doesn't provide much, for example not being able to perform or at least request transfers.
